COMPLIANT CLOUD

Compliant Cloud is IT infrastructure for any industry regulated by specific laws, regulations or simply customer demands regarding data protection.

It is an IaaS solution for organisations who are required to store data in specific locations where auditability, traceability and dependability of physical and logical access is of particular importance.

Many large organisations, particularly the ones in the heavily regulated industries such as banking, government and healthcare, have a long history of being bystanders in the global digitization trend. With Compliant Cloud from City Network all companies, regardless of their individual challenges regarding data protection, can replenish their IT infrastructure to become more flexible and cost efficient in their development of new applications and services.

REGULATORY DEMANDS

With increasing demands on regulatory challenged industries to stay at the forefront regarding data protection, the cost of maintaining that position increases. Our availability zones follow all of the standards that the national Financial Supervisory Inspectories, Data Inspection Boards and the EU demand for data protection. All of our Compliant Cloud zones are certified according to ISO 27001, 27010, 27013, 27015, 27017, 27018, 22301 and PCI-CPP - internationally recognised standards for information security, handling of payments and business continuity.

All our certificates and our zones are at our potential clients' disposal and we welcome regular visits. Our commitment is to keep up with applicable laws and regulations regarding information security and data protection in the IaaS layer, all the way up to the virtual machines. Your sole responsibility is to make sure that the software and applications you use have the same standards.

NETWORKING SERVICES AND DIRECT CONNECTIONS

To be able to reach our applications and services with fast response times is a given in this day and age. To be able to do so, you need well established and fast network connections between your data centers and offices across the globe and that is quite an endeavor for any organisation with its focus in areas outside of IT infrastructure.

City Connect is our global private network connecting all our availability zones. By utilising the extreme capacity and filtering options in any of our 30 access points we can offer a whole new set of security services to connect and protect core office networks and data centres. Benefits include fast and secure access to data in City Cloud and City Network data centres all around the world as well as fast Internet access through the same connection.

OPEN IS KEY

We have chosen to build our IT infrastructure solutions on open API standards. We do this to avoid locking our customers into a licensed infrastructure which can be difficult to change or to leave. We believe that the customer should be able to have total control over their environment regardless of whom they trust to keep it running and safe. We also believe that there shouldn't be any restrictions preventing our customers from combining their own infrastructure or other cloud services with our service offerings.

SCALABILITY AND FLEXIBILITY

Even if your organisation is not ready to trust a public cloud with your production systems, you can still benefit from our Compliant Cloud solutions designed for regulated industries. Many companies need testing and development environments and this is often a subordinated item which, in our experience, is rarely invested in. A test environment is usually needed for a short period of time and to get a test result that corresponds to a production environment you need the same setup regarding hardware, software and fast connections.

By initially running test and development environments with us, you can make better assessments which lead to better decisions. Regardless of what you run in the environment, the cost is always based on the capacity utilized, for the time it is relevant, knowing that that it is done in a modern and secure IT infrastructure solution.

WE ARE HERE TO HELP YOU

Knowing what strategy or which solution to choose is not always obvious. Our experts are here to help and can advise in technical design, multi-cloud solutions, application cloud readiness or simply regulatory compliance. Contact us today to get started.
